BLOSUM62 Gapop 10.0 , Gapext 0.5 Scoring table:

Total number of hits satisfying chosen parameters:

283366 segs, 96191526 residues

Searched:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Diri Diri Tras: * PIR 78:* Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
A; Molecule type: mRNA
A; Residues: 'N',169-307,'L',309-342 <KIN>
C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (ka;
hain disulfide bonds: In some cases, such as IgA and IgM, the subunits associate into l.
C; Superfamily: immunoglobulin C region; immunoglobulin homology
C; Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin

178k protein - tobacco mosaic virus (strain cr-TMV)

178k protein - tobacco mosaic virus (strain cr-TMV)

N/Alternate names: readthrough protein

N/Contains: 122k protein

C;Species: tobacco mosaic virus, TMV

A;Variety: strain cr-TMV

C;Date: 06-Dec-1996 #sequence_revision 06-Dec-1996 #text_change 20-Sep-1999

FUNCTION: THE SMALLER PROTEIN IS A METHYLTRANSFERASE ACTIVE IN RNA CAPPING AND AN RNA HELICASE.
CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PHOSPHORYLATION SITES.

Mol. Biol. 227:586-592(1992).

-!- FUNCTION: May confer stability to the gas vesicle membranes, Gas vesicles are small, hollow, gas filled protein structures that are found in several microbial planktonic microorganisms. They allow the positioning of the organism at the favorable depth for growth.
-!- SUBCELLULAR LOCATION: Binds to the external surface of the gas

BOMAIN 785 B14 IQ; 1.
heavy chain subunits (MHC), 2 alkali light chain subunits (MLC) and 2 regulatory light chain subunits (MLC-2).

SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

DOMAIN: The rodilke tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides, characteristic for alpha-helical coiled coils.

MISCELLANEOUS: Each myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped subfragment (S2).

SIMILARITY: Contains 1 myosin-like globular head domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

MISCELLANEOUS: Bach myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped

"Expression and DNA sequence analysis of a human embryonic skeletal muscle myosin heavy chain gene.",

"Le FUNCTION: Muscle contraction.

-: SUBUNIT: Muscle myosin is a hexameric protein that consists of 2 heavy chain subunits (MEC).

-: SUBUNIT: Muscle myosin is a hexameric protein that consists of 2 heavy chain subunits (MEC).

-: SUBUNIT: Abundant (MHC), 2 alkali light chain subunits (MLC).

-: SUBCELLUAR LOCATION: Thick filaments of the myofibrils.

-: SUBCELLUAR LOCATION: Thick filaments of the myofibrils.

-: SUBCELLUAR LOCATION: Thick filaments of the myofibrils.

-: DEVELOPMENTAL STAGES: Abundantly present in fetal skeletal and not present or barely detectable in heart and adult skeletal
                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nomo deptens vienna.).

Nadal-Gunard B.;

"Complete nuclectide and encoded amino acid sequence of a mammalian myosin heavy chain gene. Evidence against intron-dependent evolution of the rod.";

J. Mol. Biol. 199:291-317(1986).

-!- FUNCTION: Muscle contraction.

-!- FUNCTION: Muscle contraction.

-!- FUNCTION: Muscle contraction.

-!- FUNCTION: Muscle myosin is a hexameric protein that consists of 2 and 2 regulatory light chain subunits (MLC-2).

-!- SUBJUNIT: Muscle myosin is a hexameric protein that consists of 2 and 2 regulatory light chain subunits (MLC-2).

-!- SUBJUNIT: Muscle myorin subunits of the myofibrils.

-!- DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides.

-!- DOMAIN: The rodlike tail sequence is highly repetitive, showing cycles of a 28-residue repeat pattern composed of 4 heptapeptides.

-!- MISCELLANEOUS: Each myosin heavy chain can be split into 1 light meromyosin (LMM) and 1 heavy meromyosin (HMM). It can later be split further into 2 globular subfragments (S1) and 1 rod-shaped subfragment (S2).

-!- SIMILARITY: Contains 1 myosin-like globular head domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R HISSP, P1358, 2MYS.

-!- FUNICION: May mediate the control of various cellular processes binsulin. When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2.
-!- SIMILARITY: Contains 1 PH domain.
                                                                                                                                                                                         SEQUENCE FROM N.A.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

alpha-fetoprotein precursor - mouse

NyAlernate names: AFP; alpha-1-fetoprotein precursor; alpha-fetoglobulin precursor

Syspecies: Mus musculus (house mouse)

C;Date: 01-Sep-1981 #sequence revision 28-May-1986 #text_change 12-Jun-1998

C;Accession: A93254; A92305; R03235

"Three different but related gene clusters encoding gas vesicles in halophilic archaea.",
halophilic archaea.",
N. MOL. 8101. 227:586-592(1992).
-!- FUNCTION: May confer stability to the gas vesicle membranes. Gas vesicles are small, hollow, gas filled protein structures that are found in several microbial planktonic microorganisms. They allow the postitioning of the organism at the favorable depth for growth.
-!- SUBCELLULAR LOCATION: Binds to the external surface of the gas
